

The Uses of Forests

The forest is a vital part of our ecosystem. It provides oxygen, protects watersheds, offers wildlife habitats, and supports recreational activities.

A well-managed forest can offer numerous recreational opportunities such as swimming, fishing, boating, camping, hiking, and wildlife watching.

In this diorama, you'll notice a man in a chair —this is Bend Smith, a friend of the artist. Rossoll Human models were used to bring each scene in these dioramas to life.

Veneer and Plywood

On the left you can see hardwood trees that are used to make veneer. Veneer is a thin sheet of wood, uniform in thickness, that is peeled or sliced from a log, then used to make furniture, pianos, or paneling.

On the right are Pine trees. They produce plywood and pulpwood products.
